## AGRICULTURAL WEATHER OUTLOOK: FEBRUARY 21 TO 27, 2019

### HEAT COUPLED WITH PRECIPITATIONS OVER THE NORTHWEST AND EAST-CENTER OF THE AGRICULTURAL AREA WITH A FINAL MODERATE TEMPERATURE DROP.

At the beginning of the perspective, northerly winds will maintain the heat wave over most part of the agricultural region. Only the southeast will receive moderate values due to the entry of maritime air. Later on, the entry of a storm front will bring abundant / very abundant precipitations to most part of the NOA region, the east of Cuyo, most part of the Pampas region and most part of Uruguay. The rest of the area will receive values ranging from moderate to scarce. Coupled with the front, the entry of southerly winds will drop temperatures in the south, west and east of the Ag. region. The North, however, will remain under the influence of tropical winds.

## SOYBEAN

Due to the lack of rainfalls and high temperatures, almost 30% of the area is under a moisture condition ranging from dry to regular. In spite of this, more than 87% of the planted area is in a condition ranging from normal / good to excellent. Besides, more than half of the planted area is at a critical stage of yield definition. The most developed crops are at the beginning of their physiological maturity in areas of the soy belt. Under this scenario, we maintain our final production projection at 53 M tons.

## CORN

While the harvest of the most developed plots with early-planted corn progresses, most of the late and second crop corn is at a critical stage. Last week's rainfalls helped replenish the moisture in the west of the agricultural region. However, water reserves are not enough at this critical development stage for the cereals. New precipitations are likely to improve the condition of crops. In spite of this, the excellent yield perspectives of early-planted corn help us maintain our current production estimate at 45 M tons for the season 2018/19.

## SUNFLOWER

Sunflower harvest is complete in the main sunflower-producing areas of the northeast of the country. Collection progresses into regions that contribute less surface to the national total. As a consequence, the harvest is delayed until fieldwork progresses into the Buenos Aires region. To date, sunflower is 38,9% collected with an average yield of 1.94 T/H and a current production volume of 1.4 M tons. Harvest is complete in the north-center of Santa Fe, while crops in the main sunflower-producing areas of southern Buenos Aires are at the end of grain filling under good condition. We, therefore maintain our final production estimate at 3.9 M tons.

---
